

TEACHER PORTAL

Getting Started Guide

A practical first-day guide for setting up your teaching space, enrolling students, publishing learning content, and reviewing progress.

Start here

Use the portal in this order: choose your teaching environment, create student codes, confirm enrolment, then publish content or assessments.

Prepared for teachers using the Academy platform

Version: August 2026

1. Before You Begin

Your teacher account is created by the platform administrator. There is no public teacher registration page. Keep the login details provided by the administrator private.

First-login checklist

- Open the teacher login page and sign in with the credentials supplied by the administrator.
- Confirm that the dashboard displays your name and the label “teacher workspace.”
- Set the correct teaching environment before creating codes, questions, exams, videos, books, or study notes.
- Confirm that the dashboard shows the expected navigation options for the selected environment.

Important
The selected environment controls which students and content are available. When you switch environments, new codes and new content use the new selection.

Choose the teaching environment

1. Open Dashboard

Find the “Teaching environment” panel near the top of the page.

2. Select the education system

Choose American or National. Then choose the matching American category or National grade.

3. Save the selection

Select “Set environment.” Later, use “Switch environment” when you need to work with another group.

What changes by environment?

Environment	Main activity area	Organization
American	Assignments	Create assignments directly; no Unit grouping.
National	Question Bank	Create Units, then Self Practice or Homework modules.

2. Enrol Students with Invitation Codes

Students become connected to your teaching space by redeeming a secure, one-time invitation code. Generate codes only after choosing the correct environment.

1. Open Invitation codes

From the teacher menu, open “Invitation codes,” then select “Generate student codes.”

2. Confirm the target group

Check the education system and grade/category. This determines which students can use the code.

3. Choose the quantity

Generate from 1 to 20 codes in one batch.

4. Distribute securely

Copy the codes, download the generated PDF, or print one card for each student.

5. Confirm enrolment

After students redeem their codes, check the dashboard’s “Enrolled students” count and student selectors in content forms.

Code rules

Each invitation code can be redeemed once. Codes expire after 2 days. Student access to the teacher lasts 30 days after redemption.

Good practice

- Give each code to only one intended student.
- Do not post code sheets publicly or reuse a redeemed code.
- Regenerate a new code if an unused code expires.
- Revoke an active code from the invitation-code list when it should no longer be used.

Dashboard checks

Use the four dashboard cards as a quick health check: Enrolled students, Active codes, Exam completion, and Average score. Values are live and reflect the currently available records.

3. Create and Assign Learning Content

The portal supports lesson videos, material books, study notes, assignments, self-practice activities, homework, and standard exams.

Lesson videos

- Enter a title and YouTube URL; optionally add description, lesson name, and category.
- Set availability dates and a maximum number of views when required.
- Choose Publish now, then assign to all matching students or selected students.

Video privacy note

The portal controls access and playback sessions, but embedded YouTube content cannot be made fully private. Avoid uploading confidential material.

Material Books and Study Notes

- Add the title, material type, description, resource URL, and optional cover-image URL.
- Use availability dates to control when students can access the resource.
- Keep “Published” selected when the item is ready, and choose all matching students or individual students.
- For protected files, use the organization’s approved private-storage process. A shared public link can be forwarded outside the portal.

National workflow: Units and activities

1. Create a Unit

Open Question Bank, enter a Unit title and optional description, and save it.

2. Choose an activity type

Open the Unit and select Self Practice (untimed, no deadline) or Homework (untimed, with a deadline).

3. Add questions

Reuse saved questions and/or upload a question-page image. Add each question, points, choices, and at least one correct answer.

4. Assign and monitor

Assign all matching students, then use “Students & scores” to monitor submissions.

American workflow: Assignments

Open Assignments, enter the assignment title, choose saved questions or upload new question pages, mark correct answers, and assign the activity. American assignments are created directly without Units.

4. Build Exams and Review Results

Use the Exams section for timed, versioned assessments. The teacher can create a new exam, generate a random exam from earlier questions, or reuse complete pages from old exams.

Create a standard exam

1. Set exam details

Enter title, duration, description, instructions, start/end dates, maximum attempts, and optional passing score.

2. Choose the audience

Assign to all active students or clear that option and select individual students.

3. Add question pages

Upload a page image, then add all questions beneath it. Set question numbers, points, answer choices, and correct answers.

4. Preview and finish

Review the exam, then choose Save draft or Publish & assign.

Other exam options

- Random exam: choose the number of questions, timing, attempts, and students. The system draws from earlier standard exams in the active environment.
- Exam from old questions: select complete uploaded pages from previous exams and reuse all questions on those pages.
- Visibility: show or hide an exam from students from the Exams list.
- Editing: edit versioned exams from the exam list; confirm the active environment matches the exam.

Review performance

- Open an exam or activity and select “Students & scores” or the Results action.
- Review student name, attempt number, status, score, total points, and submission time.
- Select “Review answers” for the question-by-question result of a specific attempt.
- Use Dashboard Exam completion and Average score for a quick overall summary.

Publishing check

Before publishing, verify the environment, audience, availability dates, answer key, points, duration, and attempt limit. A draft is safer when the content is not fully reviewed.

5. First-Day Operating Checklist

- Sign in successfully with the teacher account.
- Select and save the correct teaching environment.
- Generate a small test batch of invitation codes.
- Ask one test student to redeem a code and confirm enrolment.
- Create one draft item (video, book, note, assignment, or activity).
- Verify the intended students appear in the assignment list.
- Create a short test exam and check all correct answers and points.
- Publish only after previewing the content and schedule.
- Submit the test as a student, then confirm the result appears.
- Sign out when work is complete, especially on a shared device.

Common problems and quick fixes

Content section is missing	Return to Dashboard and confirm the selected environment. American uses Assignments; National uses Question Bank.
No students appear	Confirm students redeemed valid codes for this teacher and still have active access.
Exam cannot be saved	Check required fields, dates, question text, at least two choices, correct answers, and selected students.
No old questions available	Create and save a regular exam or Unit activity first, in the same environment.
Student cannot open content	Check publication status, assignment, availability dates, enrolment, and any view or attempt limit.

Need help?

Contact the platform administrator when login credentials fail, the teacher profile is incomplete, the wrong role is shown, or a required database feature is unavailable. Include the page name and the exact on-screen error message, but never send passwords or invitation codes.
